ADVANCED APIS

USING `http-server`

1. At the command line, navigate to the directory containing the HTML file for your app.

2. Enter the following command:

   `http-server` `-p 3000`

   command to start the server — specifies port number to use

   Note: You can choose any port number from 1024 to 49151.

3. In your browser's address bar, type `localhost:3000` and press **Enter**.
   Note: If you chose a different port number in Step 2, use that port number instead of `3000` in this command.

4. When you're done interacting with your app, return to the command line, then press `control + C` to stop your HTTP server.

GEOLOCATION API

`navigator.geolocation`	*Access the geolocation object; falsy if not supported by user's browser*
`getCurrentPosition(success, error)`	*Method to request user's location*
`coords.latitude` `coords.longitude`	*Latitude and longitude in position object*

ENDPOINT STRUCTURE

protocol   host   resource path   query

`http://www.domain.com/path/to/resource?a=b&x=y`
